

UNABRIDGED TABLE OF REFLECTIVE LORENTZIAN LATTICES OF RANK 3

DANIEL ALLCOCK

ABSTRACT. This is the unabridged table of all 8595 rank three reflective Lorentzian lattices, intended as a supplement to the author's paper classifying them. The abridged table in that paper is complete too, but less explicit, so the main purpose of this document is archival. The TeX sourcecode is simultaneously a Perl script, which when run prints out all the lattices in computer-readable format.

See the author's paper [1] for the meaning of this table, as well as the proof and more detailed references. The following comments describe features of the table present here but not in the paper.

Names and constructions of Lattices: For a given Weyl group W_n , we index the lattices having that Weyl group as in [1], followed by those that are printed implicitly there, followed by those that are got by p -duality operations. For the lattices printed here but not there, the method of construction is stated. When L is printed explicitly or implicitly in the paper, and M is got from it by duality, we have printed all chains of p -dualities from L to M . (Except that we omit chains involving a prime p if $L \cong p\text{-dual}(L)$ or equivalently $M \cong p\text{-dual}(M)$.) This means that some lattices have more than one construction; no one of those constructions is distinguished, but the set of all of them is natural.

Reference to Nikulin's lattices: When one of our lattices appears on Nikulin's tables [2], we indicate where it does so.

Gram matrices: We computed the Gram matrices and typeset them, to see that they really do coincide with Nikulin's Gram matrices. Unfortunately this made the TeX file too large for the arxiv to accept. If you want them they you can download a version of these tables containing the Gram matrices from <http://www.math.utexas.edu/~allcock>

Date: November 19, 2010.

2000 Mathematics Subject Classification. 11H56 (20F55, 22E40).

Key words and phrases. Lorentzian lattice, Weyl group, Coxeter group, Vinberg's algorithm.

Partly supported by NSF grant DMS-0600112.

(the author's web page). Or you can extract the computer-readable data and compute them yourself.

Extracting computer-readable data: By arcane methods we have arranged for the TeX source to be simultaneously a Perl script that prints out all 8595 lattices (or just some of them) in a computer-readable format, namely the one read by the PARI/GP software. If the file is saved as `file.tex` then simply enter `perl file.tex` at the unix command line and follow the instructions that will appear.
